Monitoring Barriers – Business Imperative

Usability

No single window or platform to monitor various diverse application components

Technology Limitation

No single **tool/technology** can monitor all aspects under one umbrella

Performance

Comprehensive performance monitoring during peak loads/failures requires manual intervention

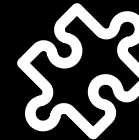

Data Ingestion

Limited visibility on what data got ingested in Data Lake or Data Warehouse, what failed and Why

Heterogeneous Data

Integrating metrics, logs, and traces is a complex process, monitoring aspects are even more complex

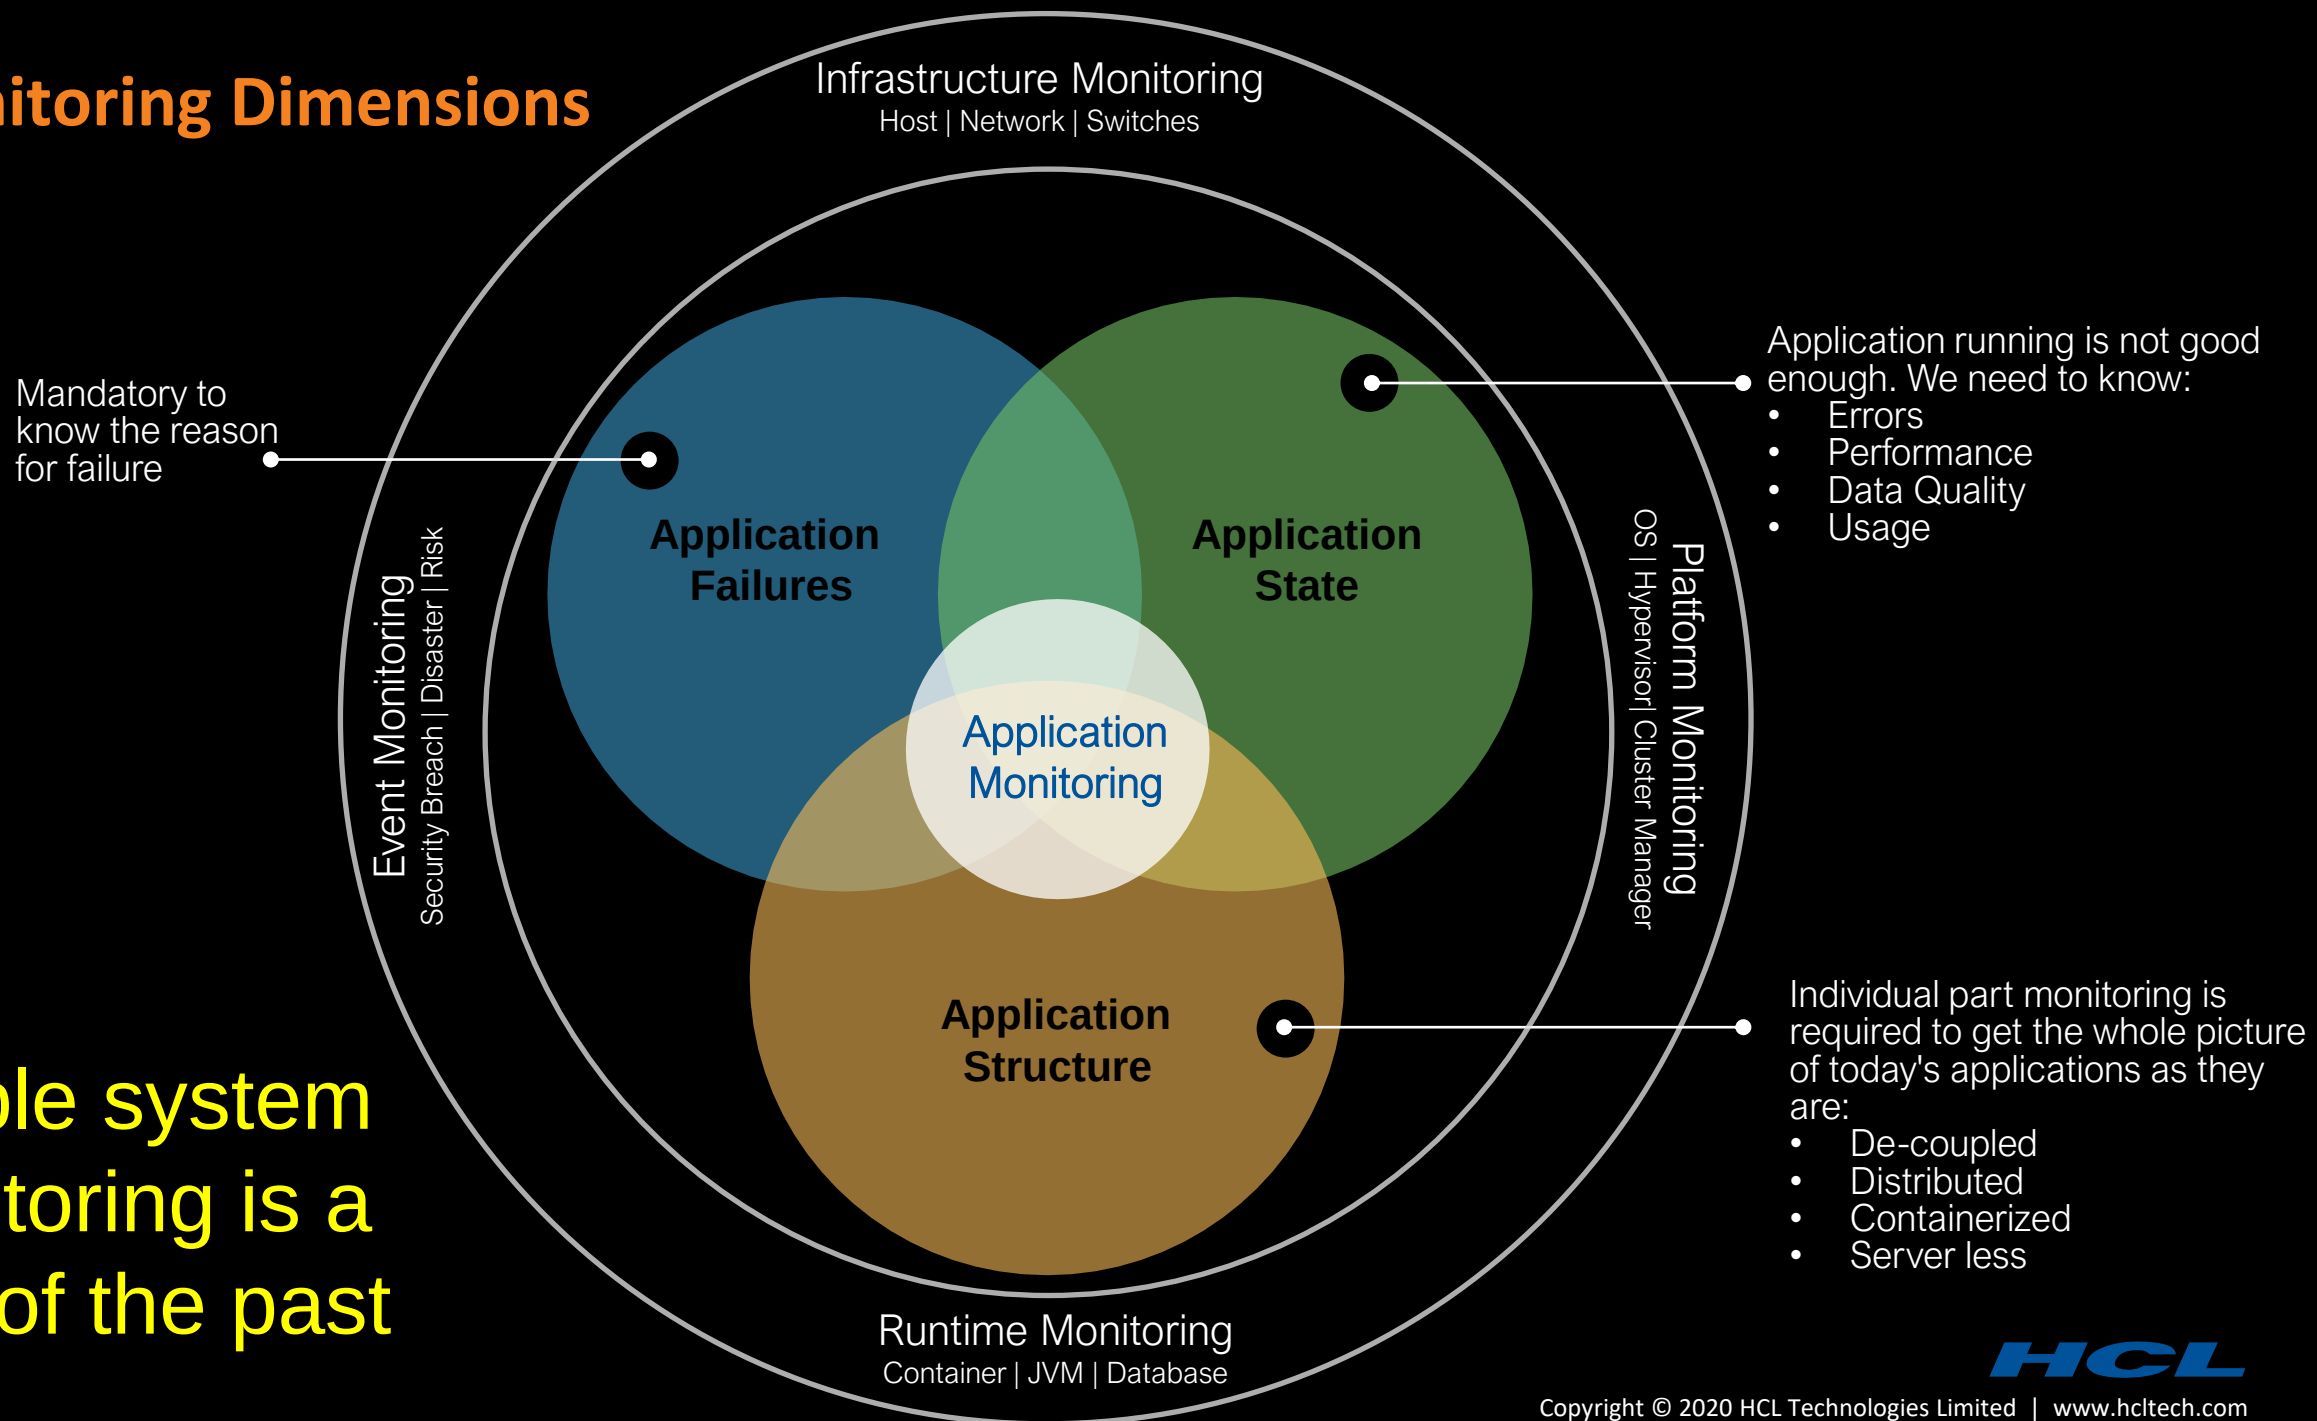

Scale

Predicting future scale-up needed based on existing resource utilization, increased data volume etc is difficult

Inefficiency in monitoring technologically diverse platforms with similar business objectives, resulting in high resource cost and effort for 90% Enterprises

Monitoring Dimensions

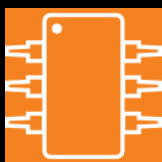

Simple system monitoring is a way of the past

iSee – Our Marquee Solution for Observability

A holistic intelligent observability platform through which you can observe contextualized events across servers and applications from a single console, provides availability and performance improvement alerts & forecasts.

OFFERINGS

Comprehensive monitoring across Systems (Nodes, CPU, Memory, data quality, jobs, usage).

Application health monitoring and forecasting

Detailed usage and performance information about application, databases, ETL and Reporting/Dashboard platforms

Circumstantial information about tools like Spark, Kafka etc.

Detection of execution anomalies

Proactive measurements for alerting systems

BENEFITS

Centralized Monitoring System

Rapid implementation based on Configurable plug-ins

Persona Driven Dashboard

30% Productivity Improvement

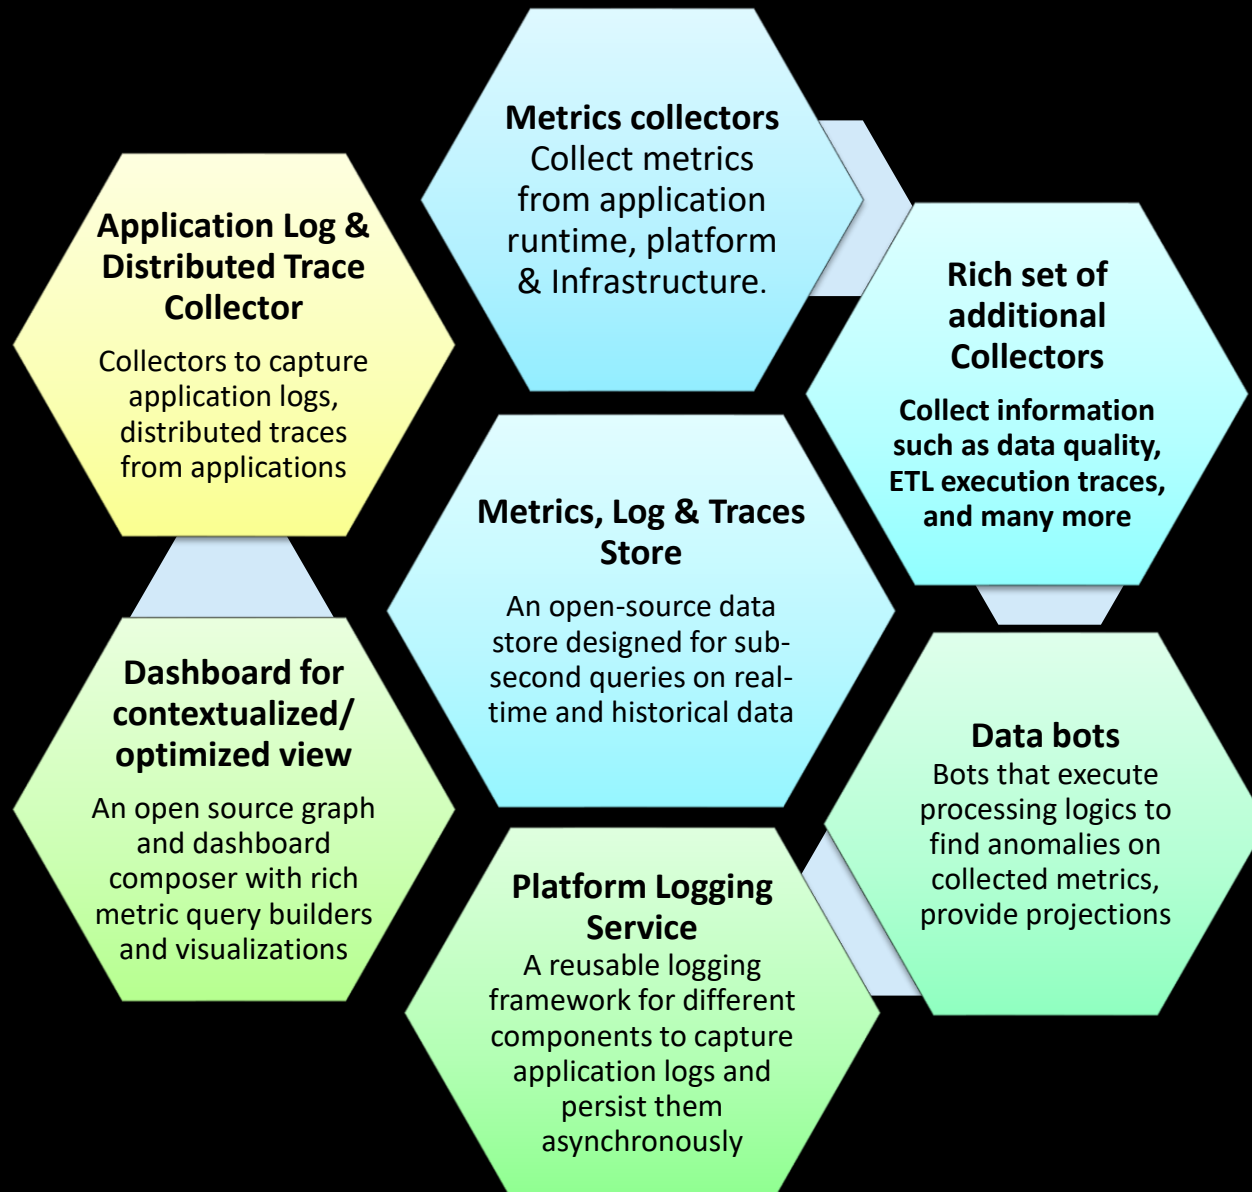

Zero manual intervention to correlate between multiple tools

Open source tools and technologies - reduces Infra and license cost

Solution components

Tools and Technologies (Open Source)

- Open source DB (InfluxDB/Cortex/Loki)
- Prometheus/Telegraf/Fluentd for collecting metrics and logs
- Jaegar/Zipkin support for distributed tracing
- ML models for anomaly detections and predictions
- Grafana for Dashboard
- Kafka for asynchronous, high performance data collection
